Automatizavimas Ansible pagalba

Laboratorinio darbo nr. 4 ataskaita

Atliko: TETfm-20 grupės magistrantas
Saulius Krasuckas
Tikrino: lekt. dr. Liudas Duoba

VILNIUS, 2022

Laboratorinis darbas nr. 4

Automatizavimas `Ansible` pagalba

Darbo tikslas

- Išbandyti `Ansible` įrankį.

Darbo eiga

Infrastruktūros paruošimas

Šiuo metu KDV naudoju *Windows 10*. Darbui atlikti pasirinkau terminalo emuliatorių *MinTTY* ir CLI įrankių sistemą *MSYS2*.
Pastaroji Windows OS emuliuoja *nix aplinką. [1]

Prisijungimas prie savo serverio nr. 1

Kol laukiau SSH paslaugos pasiekiamumo, tikrinau nurodytą TCP prievadą. Prisiminiau ir išmėginau kelis būdus:

```
$ ssh 158.129.200.236 45522
ssh: connect to host 158.129.200.236 port 22: Connection timed out
$
```

```
$ telnet 158.129.200.236 45522
Trying 158.129.200.236...
^C
$
```

```
$ ssh ssh://stud@158.129.200.236:45522
^C
$
```

Išskyrus tikrinimą `netcat` įrankiu, kurį savo klientinėje OS spėjau *tik įsidiegti*:

```
$ pacman -S openbsd-netcat
resolving dependencies...
looking for conflicting packages...
Packages (1) openbsd-netcat-1.217_2-1
Total Download Size:   0.03 MiB
Total Installed Size:  0.12 MiB

:: Proceed with installation? [Y/n]
:: Retrieving packages...
 openbsd-netcat-1.217_2-1-x86_64                                    35.4 KiB  37.8 KiB/s
00:01 [#############################################################] 100%
(1/1) checking keys in keyring
[#############################################################] 100%
(1/1) checking package integrity
[#############################################################] 100%
(1/1) loading package files
[#############################################################] 100%
(1/1) checking for file conflicts
[#############################################################] 100%
(1/1) checking available disk space
[#############################################################] 100%
:: Processing package changes...
(1/1) installing openbsd-netcat
[#############################################################] 100%
$
```

Tuomet laboratorinė SSH paslauga tapo jau pasiekiama..:

```
$ telnet 158.129.200.236 45522
Trying 158.129.200.236...
Connected to 158.129.200.236.
Escape character is '^]'.
SSH-2.0-OpenSSH_8.2p1 Ubuntu-4ubuntu0.3
^]

Connection closed by foreign host.
$
```

... ir pagaliau prisijungiau prie serverio nr.1:

```
$ ssh ssh://stud@158.129.200.236:45522
stud@158.129.200.236's password:
Welcome to Ubuntu 20.04.3 LTS (GNU/Linux 5.4.0-90-generic x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:     https://landscape.canonical.com
 * Support:        https://ubuntu.com/advantage

  System information as of Tue 07 Dec 2021 04:31:42 PM UTC

  System load:  0.0                Processes:                229
  Usage of /:   41.0% of 19.56GB   Users logged in:          0
  Memory usage: 9%                 IPv4 address for docker0: 172.17.0.1
  Swap usage:   0%                 IPv4 address for ens160:  10.128.67.8

 * Super-optimized for small spaces - read how we shrank the memory
   footprint of MicroK8s to make it the smallest full K8s around.

   https://ubuntu.com/blog/microk8s-memory-optimisation

41 updates can be applied immediately.
To see these additional updates run: apt list --upgradable

The list of available updates is more than a week old.
To check for new updates run: sudo apt update

stud@cc-lab:~$
```

- ⇒ Radau aštuonis kaimynus, turbūt grupiokų serverius nr. 1.
- ⇒ Kol neaišku, kuris IP kam priklauso, treniruosiuosi su savo serveriu `10.128.67.8` kaip pagrindiniu taikiniu.

Tikrinu `/etc/hosts` failo formatą ir turinį:

```
stud@cc-lab:~$ tail /etc/hosts
127.0.0.1 localhost
127.0.1.1 cc-lab

# The following lines are desirable for IPv6 capable hosts
::1     ip6-localhost ip6-loopback
fe00::0 ip6-localnet
ff00::0 ip6-mcastprefix
ff02::1 ip6-allnodes
ff02::2 ip6-allrouters
stud@cc-lab:~$
```

Aprašau jame savo serverį nr. 1, tik vardu `serveris2` :

```
stud@cc-lab:~$ echo '10.128.67.8    serveris2' >> /etc/hosts
-bash: /etc/hosts: Permission denied

stud@cc-lab:~$ echo '10.128.67.8    serveris2' | sudo tee -a /etc/hosts
10.128.67.8    serveris2

stud@cc-lab:~$ tail /etc/hosts
127.0.0.1 localhost
127.0.1.1 cc-lab

# The following lines are desirable for IPv6 capable hosts
::1     ip6-localhost ip6-loopback
fe00::0 ip6-localnet
ff00::0 ip6-mcastprefix
ff02::1 ip6-allnodes
ff02::2 ip6-allrouters
10.128.67.8    serveris2
stud@cc-lab:~$
```

Patikrinu vardo išsprendimą:

```
stud@cc-lab:~$ ping serveris2
PING serveris2 (10.128.67.8) 56(84) bytes of data.
64 bytes from serveris2 (10.128.67.8): icmp_seq=1 ttl=64 time=0.084 ms
64 bytes from serveris2 (10.128.67.8): icmp_seq=2 ttl=64 time=0.053 ms
^C
--- serveris2 ping statistics ---
2 packets transmitted, 2 received, 0% packet loss, time 1016ms
rtt min/avg/max/mdev = 0.053/0.068/0.084/0.015 ms
stud@cc-lab:~$
```

- ⇒ Laikinas vardas veikia.

SSH ryšio ir rakto paruošimas

Darbo su SSH raktais prisiminimui pasinaudoju straipsneliu: [2]
Sukuriu `stud` paskyrai naują SSH raktą:

```
stud@cc-lab:~$ ssh-keygen
Generating public/private rsa key pair.
Enter file in which to save the key (/home/stud/.ssh/id_rsa):
Created directory '/home/stud/.ssh'.
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
Your identification has been saved in /home/stud/.ssh/id_rsa
Your public key has been saved in /home/stud/.ssh/id_rsa.pub
The key fingerprint is:
SHA256:eRmPaDqOuSZ8j+MXGe9DMROb9ewfCVJqK/OIjWWDH4g stud@cc-lab
The key's randomart image is:
+---[RSA 3072]----+
|                 |
|        . . .    |
|         =.=     |
|      . *o+=+    |
|     . *S=++.. . |
|    E =oX.. . o  |
| .    o@ B   . . |
|  o +=+.* .   .  |
|   =*=o  .       |
+----[SHA256]-----+
stud@cc-lab:~$
```

- ⇒ Dėl patogumo ir nereikalaujamo padidinto saugumo, *Passphrase* neįjungiau (nurodžiau tuščią).
- ⇒ Kadangi pradžiai išmėginsiu raktą savo paties serveryje, viešas jo raktas išsisaugos jame pačiame kaip atskiras SSH mazgų įrašas.

- ⇒ Kadangi šiame įraše telpa ne vien IP adresas, bet ir serverio vardas, dėl tvarkos reiktų jungtis vardu (tuomet išspręstasis IP adresas išsisaugo kartu).
- ⇒ O tam, kad šio įrašo apie SSH mazgą vėliau netektų keisti / taisyti, reiktų prisijungimui naudoti jau galutinį mazgo vardą, nebe testinį `serveris2`.

Pašalinu pradinį, testinį mazgo vardą (dvi eilutes) iš sisteminės lentelės ir įrašau adekvatų vardą:

```
stud@cc-lab:~$ sudo vim /etc/hosts
  ...

stud@cc-lab:~$ echo -e '# 2021-12-07 saukrs: pradedu laborą nr. 4,\n10.128.67.8    serveris1' | sudo
tee -a /etc/hosts
# 2021-12-07 saukrs: pradedu laborą nr. 4,
10.128.67.8    serveris1
stud@cc-lab:~$
```

Įsitikinu, kad failą sukonfigūravau teisingai:

```
stud@cc-lab:~$ tail /etc/hosts
127.0.1.1 cc-lab

# The following lines are desirable for IPv6 capable hosts
::1     ip6-localhost ip6-loopback
fe00::0 ip6-localnet
ff00::0 ip6-mcastprefix
ff02::1 ip6-allnodes
ff02::2 ip6-allrouters
# 2021-12-07 saukrs: pradedu laborą nr. 4,
10.128.67.8    serveris1
stud@cc-lab:~$
```

Tikrinu vardą `serveris1`, išsisprendžia:

```
stud@cc-lab:~$ ping serveris1
PING serveris1 (10.128.67.8) 56(84) bytes of data.
64 bytes from serveris1 (10.128.67.8): icmp_seq=1 ttl=64 time=0.060 ms
64 bytes from serveris1 (10.128.67.8): icmp_seq=2 ttl=64 time=0.055 ms
^C
--- serveris1 ping statistics ---
2 packets transmitted, 2 received, 0% packet loss, time 1002ms
rtt min/avg/max/mdev = 0.055/0.057/0.060/0.002 ms
stud@cc-lab:~$
```

Jungiuosi prie savo serverio su slaptažodžiu, patvirtinu rakto eliptinį pėdsaką ir iškart atsijungiu su `^D` kombinacija:

```
stud@cc-lab:~$ ssh serveris1
The authenticity of host 'serveris1 (10.128.67.8)' can't be established.
ECDSA key fingerprint is SHA256:53taBSfMAMqEJLYWDEYZqm5IOYHYeEiBNK6eUve1agE.
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
Warning: Permanently added 'serveris1,10.128.67.8' (ECDSA) to the list of known hosts.
stud@serveris1's password:

stud@cc-lab:~$ ^D
stud@cc-lab:~$
```

- ⇒ Prieš viešojo SSH rakto kopijavimą į serverį verta patikslinti, ar serverio ECDSA (eliptinis) rakto pėdsakas yra autentiškas.

  Visiškai nesuprantu, kaip tinkamai tai padaryti + atpažinti galimą „pasiklausymą“ / MITM ataką. [3]

  Todėl tiesiog įvedžiau `yes`.
- ⇒ `serveris1` jau pilnai paruoštas jungimuisi per SSH (su slaptažodžiu).

Serverio nr. 1 savęs pasiekimas (testinis) naudojantis SSH raktu

Kopijuoju SSH raktą į savo paties (tą patį) serverį:

```
stud@cc-lab:~$ ssh-copy-id serveris1
/usr/bin/ssh-copy-id: INFO: Source of key(s) to be installed: "/home/stud/.ssh/id_rsa.pub"
/usr/bin/ssh-copy-id: INFO: attempting to log in with the new key(s), to filter out any that are
already installed
/usr/bin/ssh-copy-id: INFO: 1 key(s) remain to be installed -- if you are prompted now it is to
install the new keys
stud@serveris1's password:

Number of key(s) added: 1

Now try logging into the machine, with:   "ssh 'serveris1'"
and check to make sure that only the key(s) you wanted were added.

stud@cc-lab:~$
```

Ir tikrinu SSH prisijungimą tuo raktu:

```
stud@cc-lab:~$ ssh serveris1
Welcome to Ubuntu 20.04.3 LTS (GNU/Linux 5.4.0-90-generic x86_64)

 * Documentation:  https://help.ubuntu.com
 * Management:     https://landscape.canonical.com
 * Support:        https://ubuntu.com/advantage

  System information as of Tue 07 Dec 2021 04:54:55 PM UTC

  System load:  0.02               Processes:                233
  Usage of /:   42.0% of 19.56GB   Users logged in:          1
  Memory usage: 11%                IPv4 address for docker0: 172.17.0.1
  Swap usage:   0%                 IPv4 address for ens160:  10.128.67.8

 * Super-optimized for small spaces - read how we shrank the memory
   footprint of MicroK8s to make it the smallest full K8s around.

stud@cc-lab:~$ logout
Connection to serveris1 closed.
stud@cc-lab:~$
```

- ⇒ Testinis SSH prisijungimas raktu į `serveris1` jau irgi veikia.

Inventory failo paruošimas

Testinė konfigūracija

Bandau `/etc/hosts` formatu įtraukti `serveris1` aprašymą ir į numatytąjį inventorinį failą `/etc/ansible/hosts`:
(pažvelgus į pastarojo turinį pasirodė, jog formatas toks pats)

```
stud@cc-lab:~$ echo -e '# 2021-12-07 saukrs: pradedu laborą nr. 4,\n[servers]\n10.128.67.8
serveris2' | sudo tee -a /etc/ansible/hosts
# 2021-12-07 saukrs: pradedu laborą nr. 4,
[servers]
10.128.67.8    serveris2
stud@cc-lab:~$
```

- ⇒ Čia apibrėžiau serverių grupę `servers`.

Tikrinu inventoriaus failą:

```
stud@cc-lab:~$ ansible-inventory --list -y
[WARNING]:  * Failed to parse /etc/ansible/hosts with yaml plugin: Syntax Error while loading YAML.
did not find expected <document start>  The error appears to be in
'/etc/ansible/hosts': line 47, column 1, but may be elsewhere in the file depending on the exact
syntax problem.  The offending line appears to be:  [servers] 10.128.67.8
serveris2 ^ here
[WARNING]:  * Failed to parse /etc/ansible/hosts with ini plugin: /etc/ansible/hosts:47: Expected
key=value host variable assignment, got: serveris2
[WARNING]: Unable to parse /etc/ansible/hosts as an inventory source
[WARNING]: No inventory was parsed, only implicit localhost is available
all:
  children:
    ungrouped: {}
stud@cc-lab:~$
```

- ⇒ Bloga inventorinio failo struktūra.
- ⇒ Nors vietoj `serveris1` klaidingai įrašiau `serveris2`, kol kas situacijos tai nekeitė.

Šalinu tris savo įterptas eilutes (taisydamas failo turinį redaktoriuje):

```
stud@cc-lab:~$ sudo vim /etc/ansible/hosts
  ...
stud@cc-lab:~$
```

Kol rasiu klaidą, inventoriuje aprašau mazgą nenaudodamas vardo išvis — tik IP adresą:

```
stud@cc-lab:~$ echo -e '# 2021-12-07 saukrs: pradedu laborą nr. 4,\n[servers]\n10.128.67.8' | sudo tee
-a /etc/ansible/hosts
# 2021-12-07 saukrs: pradedu laborą nr. 4,
[servers]
10.128.67.8
```

Dabar *Ansible* inventorius pradėjo veikti:

```
stud@cc-lab:~$ ansible-inventory --list -y
all:
  children:
    servers:
      hosts:
        10.128.67.8: {}
    ungrouped: {}
stud@cc-lab:~$
```

Pirmas *Inventory* failo testas

Tikrinu *Ansible* gebėjimą jungtis prie testinio inventorinio (t. y. savo paties) serverio:

```
stud@cc-lab:~$ ansible all -m ping -u stud
10.128.67.8 | SUCCESS => {
    "ansible_facts": {
        "discovered_interpreter_python": "/usr/bin/python3"
    },
    "changed": false,
    "ping": "pong"
}
stud@cc-lab:~$
```

- ⇒ *Ansible* mazgas jau prisijungia prie paties savęs (kol kas tik IP adresu).

Inventory failo tikslinimas

LD aprašyme pagaliau atkreipiau dėmesį, kad *Ansible* `hosts` failas naudoja *kiek kitokį* formatą aprašyti mazgui.

- ⇒ Šis formatas yra lankstesnis — skirtingose situacijose turi galimybę „šakotis“: [4]

Failas	**Pirmas stulpelis**	**Antras stulpelis**
`/etc/hosts`	**<IP adresas>**	vardas
`/etc/ansible/hosts` IP adresams	**<IP adresas>**	—
`/etc/ansible/hosts` registruotuotiems vardams	vardas	—
`/etc/ansible/hosts` neregistruotiems vardams	vardas	`ansible_host=`**<IP adresas>**

- ⇒ Jis turi ir kitų galimybių (pvz. nurodyti netipinį mazgo TCP prievadą SSH prisijungimui).

Taigi, ištrinu savo pradinę `/etc/ansible/hosts` konfigūraciją:

```
stud@cc-lab:~$ sudo vim /etc/ansible/hosts
  ...
stud@cc-lab:~$
```

Papildau ją kitu formatu:

```
stud@cc-lab:~$ echo -e '# 2021-12-07 saukrs: pradedu laborą nr. 4,\n[servers]\nserver1
ansible_host=10.128.67.8' | sudo tee -a /etc/ansible/hosts
# 2021-12-07 saukrs: pradedu laborą nr. 4,
[servers]
server1 ansible_host=10.128.67.8
stud@cc-lab:~$
```

Patikrinu šį formatą — tinkamas:

```
stud@cc-lab:~$ ansible-inventory --list -y
all:
  children:
    servers:
      hosts:
        server1:
          ansible_host: 10.128.67.8
    ungrouped: {}
stud@cc-lab:~$
```

Patikrinu inventorinio failo veikimą — veikia:

```
stud@cc-lab:~$ ansible all -m ping -u stud
server1 | SUCCESS => {
    "ansible_facts": {
        "discovered_interpreter_python": "/usr/bin/python3"
    },
    "changed": false,
    "ping": "pong"
}
stud@cc-lab:~$
```

Nustoju naudoti CLI raktą `-u stud`, nes dabar virtualioje laboratorijoje magistrantai dirba vien su šia paskyra, kitų vardų nenaudojame:

```
stud@cc-lab:~$ ansible all -m ping
server1 | SUCCESS => {
    "ansible_facts": {
        "discovered_interpreter_python": "/usr/bin/python3"
    },
    "changed": false,
    "ping": "pong"
}
stud@cc-lab:~$
```

- ⇒ susipažinta su `/etc/ansible/hosts` formatu, sukurta testinė konfigūracija.

Aprašau serverį nr. 2

LD aprašo susirandu mano serveriui nr. 2 priskirtą IP adresą: `10.128.67.20`.

Pirmiausia aprašau jį `/etc/hosts` faile:

```
stud@cc-lab:~$ echo '10.128.67.20   serveris2' | sudo tee -a /etc/hosts
10.128.67.20   serveris2

stud@cc-lab:~$ tail /etc/hosts

# The following lines are desirable for IPv6 capable hosts
::1     ip6-localhost ip6-loopback
fe00::0 ip6-localnet
ff00::0 ip6-mcastprefix
ff02::1 ip6-allnodes
ff02::2 ip6-allrouters
# 2021-12-07 saukrs: pradedu laborą nr. 4,
10.128.67.8    serveris1
10.128.67.20   serveris2
stud@cc-lab:~$
```

Paskui ir *Ansible* inventoriuje:

```
stud@cc-lab:~$ echo 'serveris2 ansible_host=10.128.67.20' | sudo tee -a /etc/ansible/hosts
serveris2 ansible_host=10.128.67.20

stud@cc-lab:~$ tail /etc/ansible/hosts

# Here's another example of host ranges, this time there are no
# leading 0s:

#db-[99:101]-node.example.com

# 2021-12-07 saukrs: pradedu laborą nr. 4,
[servers]
server1 ansible_host=10.128.67.8
serveris2 ansible_host=10.128.67.20
stud@cc-lab:~$
```

- ⇒ Pastebiu netiksliai užrašytą serverio nr. 1 vardą.

Konfigūracijos klaidų taisymas

Pataisau serverio nr. 1 aprašymą redaktoriumi, rankiniu būdu:

```
stud@cc-lab:~$ sudo vim /etc/ansible/hosts
  ...
# 2021-12-07 saukrs: pradedu laborą nr. 4,
[servers]
serveris1 ansible_host=10.128.67.8
serveris2 ansible_host=10.128.67.20

47,8          All
stud@cc-lab:~$
```

Įsitikinu, kad *Inventory* papildžiau teisingai:

```
stud@cc-lab:~$ ansible-inventory --list -y
all:
  children:
    servers:
      hosts:
        serveris1:
          ansible_host: 10.128.67.8
        serveris2:
          ansible_host: 10.128.67.20
    ungrouped: {}
stud@cc-lab:~$
```

- ⇒ Jei `/etc/ansible/hosts` faile naudotume tik vardus (be IP adresų), tokias klaidas varduose (tą patį vardą, keliose vietose aprašomą skirtingai) būtų pavykę pastebėti iškart.
- ⇒ Paruoštas ir patikrintas inventoriaus failas, jame aprašytas serveris nr. 2.

Ansible prisijungimų tikrinimas

Ansible valdymo mazge startuoju komandą:

```
stud@cc-lab:~$ ansible all -m ping
The authenticity of host '10.128.67.20 (10.128.67.20)' can't be established.
ECDSA key fingerprint is SHA256:53taBSfMAMqEJLYWDEYZqm5IOYHYeEiBNK6eUve1agE.
Are you sure you want to continue connecting (yes/no/[fingerprint])? serveris1 | SUCCESS => {
    "ansible_facts": {
        "discovered_interpreter_python": "/usr/bin/python3"
    },
    "changed": false,
    "ping": "pong"
}
yes^C
serveris2 | UNREACHABLE! => {
    "changed": false,
    "msg": "Failed to connect to the host via ssh: Warning: Permanently added '10.128.67.20' (ECDSA)
to the list of known hosts.\r\nstud@10.128.67.20: Permission denied (pub
lickey,password).",
    "unreachable": true
}
stud@cc-lab:~$
```

- ⇒ Vis dar neparuošiau SSH prisijungimo iš `serveris1` į `serveris2`.

Tolimesnis SSH prisijungimų tvarkymas

Kopijuoju serverio nr. 1 raktą į serverį nr. 2:

```
stud@cc-lab:~$ ssh-copy-id serveris2
/usr/bin/ssh-copy-id: INFO: Source of key(s) to be installed: "/home/stud/.ssh/id_rsa.pub"
The authenticity of host 'serveris2 (10.128.67.20)' can't be established.
ECDSA key fingerprint is SHA256:53taBSfMAMqEJLYWDEYZqm5IOYHYeEiBNK6eUve1agE.
Are you sure you want to continue connecting (yes/no/[fingerprint])? yes
/usr/bin/ssh-copy-id: INFO: attempting to log in with the new key(s), to filter out any that are
already installed
/usr/bin/ssh-copy-id: INFO: 1 key(s) remain to be installed -- if you are prompted now it is to
install the new keys
stud@serveris2's password:

Number of key(s) added: 1

Now try logging into the machine, with:   "ssh 'serveris2'"
and check to make sure that only the key(s) you wanted were added.

stud@cc-lab:~$
```

Antras prisijungimų tikrinimas

```
stud@cc-lab:~$ ansible all -m ping
serveris1 | SUCCESS => {
    "ansible_facts": {
        "discovered_interpreter_python": "/usr/bin/python3"
    },
    "changed": false,
    "ping": "pong"
}
serveris2 | SUCCESS => {
    "ansible_facts": {
        "discovered_interpreter_python": "/usr/bin/python3"
    },
    "changed": false,
    "ping": "pong"
}
stud@cc-lab:~$
```

- ⇒ Galų gale abu serveriai atsiliepia tinkamai. Rezultatas panašus į pateiktąjį LD apraše. *Ansible* valdymo mazgas palaiko ryšį su dviem serveriais (vienu testiniu ir vienu produkciniu).

Nuotolinis komandų vykdymas

LD užduoties *Ad-hoc* komandos

```
stud@cc-lab:~$ ansible all -a "df -h"
serveris1 | CHANGED | rc=0 >>

ions=gssapi-with-mic,gssapi-keyex,hostbased,publickey -o PasswordAuthentication=no -o
ConnectTimeout=10 -o ControlPath=/home/stud/.ansible/cp/62369c22bf -tt 10.128.67.8 /bin
/sh -c '/usr/bin/python3 /home/stud/.ansible/tmp/ansible-tmp-1638897559.5734017-
231528218158292/AnsiballZ_command.py && sleep 0'
stud     pts/3    10.128.67.8      17:19    1.00s  0.21s  0.01s w
stud@cc-lab:~$
```

- ⇒ Gavau prisijungusių vartotojų skaičių ir aktyvias vykdomas programas.
- ⇒ Čia atsitiktinai pastebiu, kad *Ansible* jungimuisi į serverius naudoja komandą `ssh` su gana ilga komandine eilute:

```
ssh \
  -C \
  -o ControlMaster=auto \
  -o ControlPersist=60s \
  -o KbdInteractiveAuthentication=no \
  -o PreferredAuthentications=gssapi-with-mic,gssapi-keyex,hostbased,publickey \
  -o PasswordAuthentication=no \
  -o ConnectTimeout=10 \
  -o ControlPath=/home/stud/.ansible/cp/62369c22bf \
  -tt \
  10.128.67.8 /bin/sh \
  -c '/usr/bin/python3 \
        /home/stud/.ansible/tmp/ansible-tmp-1638897559.5734017-231528218158292/AnsiballZ_command.py
\
      && sleep 0'
```

- ⇒ ... ir nuotoliniame serveryje startuoja tokį *Python* skriptą:

```
/usr/bin/python3 /home/stud/.ansible/tmp/ansible-tmp-1638897559.5734017-
231528218158292/AnsiballZ_command.py
```

- ⇒ Panašu, kad skriptą `AnsiballZ_command.py` *Ansible* į nuotolinį serverį sau nusikopijuoja prieš pat vykdymą.

Leidžiu paskutinę paprastą komandą:

```
stud@cc-lab:~$ ansible all -a "lsb_release -d"
serveris1 | CHANGED | rc=0 >>
Description:    Ubuntu 20.04.3 LTS
serveris2 | CHANGED | rc=0 >>
Description:    Ubuntu 20.04.3 LTS
stud@cc-lab:~$
```

- ⇒ Visos paprastos (pavienės) *Ad-hoc* komandos veikia.

Kompozitinės *Ad-hoc* komandos

Mėginu komandą `lscpu | awk '/^CPU/'` nustatyti mašinos CPU branduolių skaičiui:

```
stud@cc-lab:~$ ansible all -a "lscpu | awk '/^CPU/'"
serveris2 | FAILED | rc=1 >>
lscpu: bad usage
Try 'lscpu --help' for more information.non-zero return code
serveris1 | FAILED | rc=1 >>
lscpu: bad usage
Try 'lscpu --help' for more information.non-zero return code
stud@cc-lab:~$
```

- ⇒ Neveikia, ir neaišku, kokią komandinę eilutę `lscpu` gavo, kad „pyksta“.

Mėginu visą komandą įvykdyti *Bash* pagalba:

```
stud@cc-lab:~$ ansible all -a bash -c "lscpu | awk '/^CPU/'"
serveris1 | FAILED | rc=-1 >>
the connection plugin 'lscpu | awk '/^CPU/'' was not found
serveris2 | FAILED | rc=-1 >>
the connection plugin 'lscpu | awk '/^CPU/'' was not found
stud@cc-lab:~$
```

- ⇒ Blogai: šitaip raktą `-c` *Ansible* pasiima sau ir pasimeta.

Visą komandinę eilutę kartu su `bash` apgaubiu išorinėmis dvigubomis kabutėmis (kaip vientisą, vieną argumentą), o vidines dvigubąsias „eskeipinu“:

```
stud@cc-lab:~$ ansible all -a "bash -c \"lscpu | awk '/^CPU.s/'\""
serveris1 | CHANGED | rc=0 >>
CPU(s):                          2
serveris2 | CHANGED | rc=0 >>
CPU(s):                          2
stud@cc-lab:~$
```

- ⇒ Pagaliau veikia. Beje, `awk` komandą šiek tiek papildžiau, kad grąžintų tik vieną eilutę per mazgą.

Pamėginu išsitraukti ir CPU taktinį dažnį:

```
stud@cc-lab:~$ ansible all -a "bash -c \"lscpu | awk '/^CPU.s|Hz/'\""
serveris1 | CHANGED | rc=0 >>
CPU(s):                          2
Model name:                      Intel(R) Xeon(R) CPU           E5645  @ 2.40GHz
CPU MHz:                         2400.085
serveris2 | CHANGED | rc=0 >>
CPU(s):                          2
Model name:                      Intel(R) Xeon(R) CPU           E5620  @ 2.40GHz
CPU MHz:                         2400.085
stud@cc-lab:~$
```

- ⇒ *Ansible* geba vykdyti ir *Bash*-kompozitines *Ad-hoc* komandas.
- ⇒ Pamiršau patikrinti *Ansible* hostų grupavimą, t.y. nurodyti serverių grupę `servers` vietoje `all`. Esu įsitikinęs, kad ji veiktų taip pat puikiai.

(Bonus) *Ansible* grojaraščių vykdymas

Pradedu kurti atskirą grojaraštį (*Playbook*):

```
stud@cc-lab:~$ ls -Al
total 52
drwxrwxr-x 4 stud stud 4096 Dec  7 16:57 .ansible
-rw------- 1 stud stud 1005 Dec  7 16:54 .bash_history
-rw-r--r-- 1 stud stud  220 Oct 19 14:14 .bash_logout
-rw-r--r-- 1 stud stud 3771 Oct 19 14:14 .bashrc
drwxrwxr-x 3 stud stud 4096 Oct 19 16:23 build
drwx------ 2 stud stud 4096 Oct 19 14:21 .cache
-rw------- 1 stud stud   39 Dec  7 16:41 .lesshst
drwxrwxr-x 3 stud stud 4096 Oct 19 16:08 .local
-rw-r--r-- 1 stud stud  807 Oct 19 14:14 .profile
drwxr-xr-x 3 stud stud 4096 Oct 19 15:40 snap
drwx------ 2 stud stud 4096 Dec  7 17:07 .ssh
-rw-r--r-- 1 stud stud    0 Oct 19 14:15 .sudo_as_admin_successful
drwxrwxr-x 2 stud stud 4096 Oct 19 15:40 test
-rw------- 1 stud stud 1162 Dec  7 16:38 .viminfo

stud@cc-lab:~$ mkdir src

stud@cc-lab:~$ cd src

stud@cc-lab:~/src$ vim saukrs-1.yml
  ...
```

Kopijuoju pavyzdį iš *Red Hat* Blog-įrašo: [5]

```
# 2021-12-07 saukrs: kopijuoju iš https://www.redhat.com/en/blog/ansible-101-ansible-beginners
#
- name: saukrs Playbook nr.1
  hosts: serveris2
  tasks:
    - name: diegiame nginx
        yum:
          name: nginx
          state: present
```

Bandau grojaraštį:

```
[1]+  Stopped                 vim saukrs-1.yml

stud@cc-lab:~/src$ ansible-playbook saukrs-1.yml
ERROR! Syntax Error while loading YAML.
  mapping values are not allowed in this context

The error appears to be in '/home/stud/src/saukrs-1.yml': line 7, column 12, but may
be elsewhere in the file depending on the exact syntax problem.

The offending line appears to be:

    - name: diegiame nginx
        yum:
           ^ here
stud@cc-lab:~/src$
```

- ⇒ Klaida. Bet ne faktas, kad septintoje eilutėje.

Įterpiu YAML pradžios žymę `---` :

```
stud@cc-lab:~/src$ fg
```

```
---
# 2021-12-07 saukrs: kopijuoju iš https://www.redhat.com/en/blog/ansible-101-ansible-beginners
- name: saukrs Playbook nr.1
  hosts: serveris2
  tasks:
    - name: diegiame nginx
        yum:
          name: nginx
          state: present
```

- ⇒ Klaida išlieka tokia pati.

Įsikopijuoja kitą pavyzdį: [6]

```
stud@cc-lab:~/src$ vim saukrs-2.yml
```

```
---
- hosts: all
  become: yes
  tasks:
  - name: Install packages
    apt:
      name:
      - ntpdate
      - nmap
      state: latest
      cache_valid_time: 3600
```

Bandau antrą grojaraštį:

```
[1]+  Stopped                 vim saukrs-2.yml
stud@cc-lab:~/src$ ansible-playbook saukrs-2.yml

PLAY [all]
*************************************************************************************************************
***********************************************************

ignored=0
serveris2                  : ok=2    changed=1    unreachable=0    failed=0    skipped=0    rescued=0
ignored=0

stud@cc-lab:~/src$
```

- ⇒ *Ansible* paprašė slaptažodžio — spėjau, kad `stud` paskyros, ir pataikiau, regis.
- ⇒ Žingsnis `[Install packages]` užtruko ilgiausiai:
  - `serveris1` apie 10 s.
  - `serveris2` apie 20 s.
- ⇒ Grojaraštis grąžina `ok=2` ir `failed=0`.
- ⇒ Panašu, kad jis įdiegė / atnaujino abu nurodytus paketus: `ntpdate` ir `nmap`. Paketų būsenos tiesiogiai nepatikrinau.

Nutariau pasitikrinti, ką tiksliai vykdo *Ansible* ir kuri komanda paprašo `sudo` slaptažodžio. Dėstytojas pasiūlė naudoti `-v` ar net `-vvv`, mėginu:

```
stud@cc-lab:~/src$ ansible-playbook saukrs-2.yml -vvv
ansible-playbook 2.9.6
  config file = /etc/ansible/ansible.cfg
  configured module search path = ['/home/stud/.ansible/plugins/modules',
'/usr/share/ansible/plugins/modules']
  ansible python module location = /usr/lib/python3/dist-packages/ansible
  executable location = /usr/bin/ansible-playbook
  python version = 3.8.10 (default, Sep 28 2021, 16:10:42) [GCC 9.3.0]
Using /etc/ansible/ansible.cfg as config file
host_list declined parsing /etc/ansible/hosts as it did not pass its verify_file() method
script declined parsing /etc/ansible/hosts as it did not pass its verify_file() method
auto declined parsing /etc/ansible/hosts as it did not pass its verify_file() method
Parsed /etc/ansible/hosts inventory source with ini plugin

*********************************************************************************************************
**********************************************************
serveris1                  : ok=0    changed=0    unreachable=0    failed=1    skipped=0    rescued=0
ignored=0
serveris2                  : ok=0    changed=0    unreachable=0    failed=1    skipped=0    rescued=0
ignored=0

stud@cc-lab:~/src$
```

- ⇒ Duomenų gavau išties daug.
- ⇒ Į serverį SFTP įrankiu kopijuojamas ir per SSH vykdomas failas `AnsiballZ_setup.py`, kurį jau identifikavau anksčiau.
- ⇒ Iš to vis tiek neaišku, ką tiksliai tas *Python* skriptas veikia ir ar viduje panaudoja `sudo`.
- ⇒ Tik ataskaitos kūrimo metu pastebėjau, kad `sudo` naudojama *Ansible* viduje taip:

```
sudo \
    -H \
    -S \
    -n \
    -u root \
    /bin/sh \
           -c ' \
               echo BECOME-SUCCESS-xucyadvmmhrwwkflwsxapwvnhklmvrvo ; \
               /usr/bin/python3 \
                   /home/stud/.ansible/tmp/ansible-tmp-1638899019.7293622-
253348797528778/AnsiballZ_setup.py \
           '
&& sleep 0
```

- ⇒ Dabar akivaizdu, kad *Ansible* pagal nutylėjimą tikrai bando persijungt į `root` vartotoją: `-u root`.

Gavau dėstytojo patarimą greta `become:` instrukcijos panaudoti `become_user:` ir nurodyti jai reikšmę `stud`.

Papildau antrąjį, veikiantį grojaraštį komentaru su jo kilmės nuoroda bei šia instrukcija:

```
stud@cc-lab:~/src$ fg

---
# 2021-12-07 saukrs: paėmiau iš https://techexpert.tips/ansible/ansible-playbook-examples-ubuntu-
linux/ ,
  ...
  become: yes
  become_user: stud
  ...
```

Ir jį patikrinu:

```
[1]+  Stopped                 vim saukrs-2.yml
stud@cc-lab:~/src$ ansible-playbook saukrs-2.yml

stud@cc-lab:~/src$
```

- ⇒ `BECOME password:` nebeprašomas, iš vienos pusės džiugu.
- ⇒ Iš kitos pusės *Ansible* dabar nebedarė jokių pakeitimų.
  Jei paketai serveriuose dar būtų neįdiegti ar neatnaujinti, `sudo` slaptažodžio turbūt vis tiek prireiktų.
- ⇒ Kaip elgtųsi *Ansible* pastaruoju atveju (ar paprašytų slaptažodžio ne iškart, vėliau, ar tiesiog sustotų ir pateiktų klaidą), lieka man neaišku ir neištestuota.

Laboratorinio darbo pabaiga

- Susipažinta su *Ansible* sistema iš naudotojo pusės.
- Sukurtas inventoriaus failas.
- Patikrintas nuotolinis komandų vykdymas.
- Patikrintas grojaraščio vykdymas
- Susipažinta truputį ir su *Ansible* vidiniu mechanizmu (angl. *Under the hood*).

  Toks pažinimo būdas klasikinėje elektronikos inžinieriaus mąstysenoje (angl. *From the bottom up*, nuo įrangos iki abstraktesnių lygmenų) yra tiesiausias link užtikrinto sistemos supratimo (bent jau mano atveju).
- Laboratorinis darbas man suteikė praktiškai naudingų įgūdžių (užtikrintumą).
